

Quiz 4

Davis
M212

Name:
Pledge:

- (9pts.) 1. A big oil company locates a vast oil reserve under the ocean. After 5 years of development, they expect to begin extracting oil at the rate of $q(t) = 5 + t$ million barrels of oil per year (t is measured in years from discovery). If oil costs \$20 per barrel, compute the present value of the oil that will be sold over the first 15 years of production.

(NOTE: USE 5% AS INTEREST RATE)

$$\text{Present Value} = \int_5^{20} (5+t)(20)e^{-.05t} dt = 20e^{-.05t}/(-.05)(5+t+20)|_5^{20} = 20(45e^{-1}/(-.05) - 30e^{-.25}/(-.05)) = 2723.8 \text{ million dollars.}$$

- (11pts.) 2. Match the slope fields with their differential equations. Then choose two of the differential equations to solve algebraically by separation of variables.

a. $\frac{dy}{dx} = y + x^2y$

$$y = e^{x+x^3/3+C}$$

b. $\frac{dy}{dx} = xy^2 \sin(x^2)$

$$1/y = -1/2 \cos(x^2) + C$$

c. $\frac{dy}{dx} = y + xy$

$$y = e^{x+x^2/2+C}$$

d. $\frac{dy}{dx} = xe^y$

$$-e^{-y} = x^2/2 + C$$
