

# CHAPTER 18

# RECURSION

ACKNOWLEDGEMENT: THESE SLIDES ARE ADAPTED FROM SLIDES PROVIDED WITH INTRODUCTION TO JAVA PROGRAMMING, LIANG (PEARSON 2014)

# OVERVIEW

- **Recursion** is an algorithmic technique where a function calls itself directly or indirectly.
- Why learn recursion?
  - New mode of thinking.
  - Powerful programming paradigm.
- Many computations are naturally self-referential.
  - A folder containing files and **other folders**.
  - Mathematical sequences -  $f_{n+1} = f_n + 1$  (whole numbers)
  - Exploring mazes – make a step in the maze, then keep **exploring the maze**

# EXAMPLE COUNTING

- Lets take an example of counting from 0
- The next number is the previous number plus 1, or mathematically:

$$f_n = f_{n-1} + 1, \text{ where } f_0 = 0$$

- So lets compute  $f_5$ 
  - $f_5 = f_4 + 1$ , this would be great if we knew  $f_4$ , so lets expand it
  - $f_5 = (f_3 + 1) + 1$ , then
  - $f_5 = ((f_2 + 1) + 1) + 1$ , then
  - $f_5 = (((f_1 + 1) + 1) + 1) + 1$ , then
  - $f_5 = (((((f_0 + 1) + 1) + 1) + 1) + 1) + 1$ , then finally
  - $f_5 = ((((((0) + 1) + 1) + 1) + 1) + 1) + 1) + 1 = 5$

# PRACTICE RECURSIVE FORMULAS

## FIBONACCI SEQUENCE

- The Fibonacci Sequence is used in various places in mathematics and computer science

$$f_n = f_{n-1} + f_{n-2}, \text{ where } f_0 = 0, f_1 = 1$$

- Expand and evaluate  $f_6$ , work with a partner and show your work

# HOW DO WE DO RECURSION IN CODE?

- Simply call the function within its own body

```
public static void foo() {  
    //possibly do some stuff  
    foo(); //This example of recursion  
    //prossibly do some more stuff  
}
```

re•cur•sion [ri-kur-zhuhn]  
n. See recursion.

# EXAMPLE COUNTING

```
//This function counts using recursion
public static int recursiveCount(int n) {
    //f0 = 0
    if(n == 0)
        return 0;
    //fn = fn-1 + 1
    return recursiveCount(n-1) + 1;
}
```

- Together lets trace  
System.out.println(recursiveCount(3));
- recursiveCount(3)
  - return recursiveCount(2) + 1
    - return recursiveCount(1) + 1;
      - return recursiveCount(0) + 1;
        - return 0;
      - return 0 + 1;
    - return 1 + 1;
  - return 2 + 1;
- 3

# PRACTICE RECURSIVE CODE

## FIBONACCI SEQUENCE

- Write a Java function Fibonacci for

$$f_n = f_{n-1} + f_{n-2}$$

```
public static int Fibonacci(int n) {  
    if(n == 0) return 0;  
    if(n == 1) return 1;  
    return Fibonacci(n-1) + Fibonacci(n-2);  
}
```

- Practice tracing Fibonacci(3)

- **Fibonacci(3)**

- **return Fibonacci(2) + Fibonacci(1);**
  - **return Fibonacci(1) + Fibonacci(0);**
    - **return 1;**
  - **return 1 + Fibonacci(0);**
    - **return 0;**
  - **return 1 + 0;**
- **return 1 + Fibonacci(1);**
  - **return 1;**
- **return 1 + 1;**

- 2

# CHARACTERISTICS OF RECURSION

- All recursive methods have the following characteristics:
  - One or more **base cases** (the simplest case) are used to stop recursion.
  - Every recursive call reduces the original problem, bringing it increasingly closer to a base case until it becomes that case.
- In general, to solve a problem using recursion, you break it into **subproblems**. If a subproblem resembles the original problem, you can apply the same approach to solve the subproblem recursively. This subproblem is almost the same as the original problem in nature with a smaller size.

# DESIGNING RECURSIVE FUNCTIONS

- Identify the base case
  - The base case is the part of the recursion not defined in terms of itself, e.g.,  $f_0 = 0, f_1 = 1$
  - This is when the recursion stops! If you forget your base case, then the world will end
    - Really an infinite series of function calls until your computer crashes (if it ever does)
- Identify the recursive process
  - This is the algorithmic process or algorithmic formula
- Write the code

# PRACTICE DESIGNING RECURSIVE FUNCTIONS

## GREATEST COMMON DENOMINATOR (GCD)

- GCD

- For two integers  $p$  and  $q$ , if  $q$  divides  $p$  then the GCD of  $p$  and  $q$  is  $q$
- Otherwise the GCD of  $p$  and  $q$  is the same as  $q$  and  $p \% q$

- Step 1: Identify the base case

- $q = 0$  implies that the GCD is  $p$

- Step 2: Identify the recursive step

- $GCD(q, p \% q)$

- Step 3: Code

```
1. public static int gcd(  
    int p, int q) {  
2.     if (q == 0) return p;  
3.     return gcd(q, p % q);  
4. }
```

# RECURSIVE GCD DEMO

```
1. public class Euclid {  
2.     public static int gcd(int p, int q) {  
3.         if (q == 0) return p;  
4.         else return gcd(q, p % q);  
5.     }  
6.  
7.     public static void main(String[] args) {  
8.         System.out.println(gcd(1272, 216));  
9.     }  
10. }
```

$p = 1272, q = 216$

Memory gcd call - 1

gcd(1272, 216)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

$p = 1272, q = 216$

Memory gcd call - 1

gcd(1272, 216)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

$p = 1272, q = 216$

Memory gcd call - 1

gcd(1272, 216)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

$p = 1272, q = 216$

Memory gcd call - 1

$$1272 = 216 \times 5 + 192$$

gcd(1272, 216)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

$p = 216, q = 192$

Memory gcd call - 2

gcd(216, 192)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

$p = 1272, q = 216$

Memory gcd call - 1

gcd(1272, 216)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

$p = 216, q = 192$

Memory gcd call - 2

gcd(216, 192)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

$p = 1272, q = 216$

Memory gcd call - 1

gcd(1272, 216)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

$p = 216, q = 192$

Memory gcd call - 2

gcd(216, 192)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

p = 1272, q = 216

Memory gcd call - 1

gcd(1272, 216)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

p = 216, q = 192

Memory gcd call - 2

gcd(216, 192)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

p = 192, q = 24

Memory gcd call - 3

gcd(192, 24)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

p = 1272, q = 216

Memory gcd call - 1

gcd(1272, 216)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

p = 216, q = 192

Memory gcd call - 2

gcd(216, 192)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

p = 192, q = 24

Memory gcd call - 3

gcd(192, 24)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

p = 1272, q = 216

Memory gcd call - 1

gcd(1272, 216)

```

static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

24

$p = 1272, q = 216$

Memory gcd call - 1

gcd(1272, 216)

```
static int gcd(int p, int q) {  
    if (q == 0) return p;  
    else return gcd(q, p % q);  
}
```

24

```
public class Euclid {  
    public static int gcd(int p, int q) {  
        if (q == 0) return p;  
        else return gcd(q, p % q);  
    }  
  
    public static void main(String[] args) {  
        System.out.println(gcd(p, q));  
    }  
}
```

24

# RECURSIVE HELPER METHODS

- Many of the problems presented in the early chapters can be solved using recursion if you think recursively. For example, the palindrome problem can be solved recursively as follows:

```
1. public static boolean isPalindrome(String s) {
2.     if (s.length() <= 1) // Base case
3.         return true;
4.     else if (s.charAt(0) != s.charAt(s.length() - 1)) // Base case
5.         return false;
6.     else
7.         return isPalindrome(s.substring(1, s.length() - 1));
8. }
```

# RECURSIVE HELPER METHODS

- The preceding recursive `isPalindrome` method is not efficient, because it creates a new string for every recursive call. To avoid creating new strings, use a helper method:

```
1.  public static boolean isPalindrome(String s) {
2.      return isPalindrome(s, 0, s.length() - 1);
3.  }
4.  public static boolean isPalindrome(String s, int low, int high) {
5.      if (high <= low) // Base case
6.          return true;
7.      else if (s.charAt(low) != s.charAt(high)) // Base case
8.          return false;
9.      else
10.         return isPalindrome(s, low + 1, high - 1);
11. }
```

The background features a subtle pattern of concentric circles. The corners are decorated with stylized circuit board traces in dark blue and light blue. The main text is centered in a bold, black, sans-serif font.

# EXERCISE – PROGRAM TOGETHER

DOWNLOAD STDDRAW – LETS DRAW A TREE!

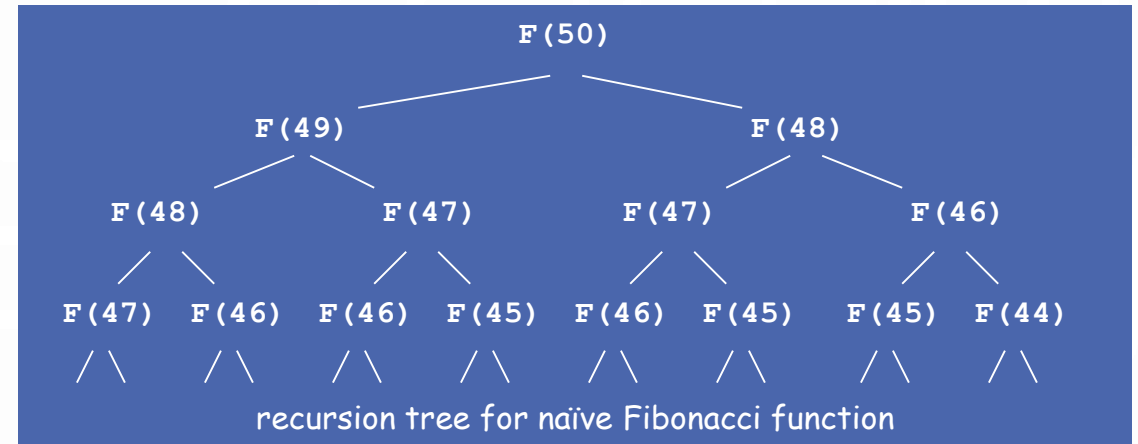

# CODE

```
1. import java.util.Scanner;
2. public class Tree {
3.     public static void drawTree(int o) {
4.         drawTree(o, 0., 0., 60,
5.             Math.PI/2, 35*Math.PI/180);
6.     }
7.     public static void drawTree(
8.         int o, double x,
9.         double y, double l,
10.        double t1, double t2) {
11.        if(o < 0) return;
12.        double x2 = x + l * Math.cos(t1);
13.        double y2 = y + l * Math.sin(t1);
14.        StdDraw.line(x, y, x2, y2);
15.        drawTree(o - 1, x2, y2, l*0.6, t1 + t2, t2);
16.        drawTree(o - 1, x2, y2, l*0.6, t1 - t2, t2);
17.    }
18. }
19. public static void main(String args[]) {
20.     Scanner in = new Scanner(System.in);
21.     System.out.print("Enter an order: ");
22.     int order = in.nextInt();
23.     StdDraw.setXscale(-200, 200);
24.     StdDraw.setYscale(0, 400);
25.     StdDraw.enableDoubleBuffering();
26.     drawTree(order);
27.     StdDraw.show();
28. }
```

# DOWNSIDE OF RECURSION

- Recursion is not always efficient!
- Take for instance, the Fibonacci sequence

```
public static long F(int n) {  
    if (n == 0) return 0;  
    if (n == 1) return 1;  
    return F(n-1) + F(n-2);  
}
```

- F(50) is called once.
- F(49) is called once.
- F(48) is called 2 times.
- F(47) is called 3 times.
- ...
- F(1) is called 12,586,269,025 times.

# BEST PRACTICE

## CONVERT RECURSIVE ALGORITHMS TO ITERATIVE ONES

- Try to do this whenever possible
- Example Fibonacci Sequence

```
1. //This is an example conversion. You can be even more efficient!
2. public static long F(int n) {
3.     if (n == 0) return 0;
4.     if (n == 1) return 1;
5.     int fn2 = 0;
6.     int fn1 = 1;
7.     int fn = 1;
8.     // Iterative means repetition until failure condition,
9.     // typically done with loops and not recursion
10.    for (int i = 2; i <= n; i++) {
11.        fn = fn1 + fn2;
12.        fn2 = fn1;
13.        fn1 = fn;
14.    }
15.    return fn;
16. }
```

# OR DO TAIL RECURSION

- Tail recursion is when the last operation of a function is the recursive call
- Example with factorial:

$$f_n = n * f_{n-1}$$

```
1. public static long factorial(  
    int n) {  
2.     if (n == 0) return 1;  
3.     else  
4.         return n*factorial(n-1);  
5. }
```

```
1. public static long factorial(  
    int n) {  
2.     return factorial(n, 1);  
3. }  
4. public static long factorial(  
    int n, int result) {  
5.     if (n == 0) return result;  
6.     else  
7.         return factorial(  
            n - 1, n * result);  
8. }
```

# SUMMARY

- How to write simple recursive programs?
  - Base case, reduction step.
- Trace the execution of a recursive program.
- Why learn recursion?
  - New mode of thinking.
  - Powerful programming tool

# TOWERS OF HANOI

<http://en.wikipedia.org/wiki/Image:Hanoikleim.jpg>

# PRACTICE

## TOWERS OF HANOI

- Design recursive algorithm to move all the discs from the leftmost peg to the rightmost one.
  - Only one disc may be moved at a time.
  - A disc can be placed either on empty peg or on top of a larger disc.

start

finish

# SOLUTION

## TOWERS OF HANOI

Move  $n-1$  smallest discs right.

Move largest disc left.

Move  $n-1$  smallest discs right.

# CODE

## TOWERS OF HANOI

```
1. public class TowersOfHanoi {
2.     public static void moves(int n,
3.         char from, char to, char aux) {
4.         if (n == 0) return;
5.         moves(n-1, from, aux, to);
6.         System.out.printf("Move disk %d from peg %c to peg %c", n, from, to);
7.         moves(n-1, aux, to, from);
8.     }
9.
10.    public static void main(String[] args) {
11.        moves(3, 'A', 'C', 'B');
12.    }
13. }
```
